

Reducing Your

Carbon Footprint With

Renewable Fuel Oil (RFO) which is a 100% naturally derived oil from sustainably sourced wood-based products. ENSYN, in response to environmental concerns, developed an alternative fuel from a renewable resource to help facilities lower their carbon footprint.

Environmental Benefits

- Reduces Green House Gas emissions by 70-90%.
- Verified by the California Air Resources Board.
- Approved by the U.S. Environmental Protection Agency (EPA).
- Reduces the risk of wildfires by incentivizing the sale of low-value forest residuals.
- RFO combustion emissions compare favorably with fossil fuel.
 - Up to 85% CO₂ reduction for typical fossil fuels.

Facility Benefits

- RFO is 100% renewable and carries the highest RIN rating (D7).
- RFO is not subject to traditional energy market volatility.
- RFO is superior to heavy oil with lower sulfur content, thus lower SO_x emissions.

**Reduce
GHG by
Up To
70-90%**
