Press Release

“Will Your E-Gen Run When You Need It?” **New Automatic Fuel Oil Maintenance System**

Danbury, CT - October 29, 2002 - Preferred Utilities announces the launch of a **NEW** Automatic Fuel Oil Maintenance System. Periodic emergency diesel engine load tests are too short to detect contaminated fuel or cause filters or injectors to clog. Is your fuel supply ready to support sustained Emergency Diesel Engine operation? Vented tanks are continuously subjected to water addition due to condensation of atmospheric water vapor. Idle fuel oil grows “ALGAE”. Without appropriate fuel maintenance the resulting sludge left in the system can cause tank, fuel line, strainer, pump and engine injectors to clog. NFPA 110 recommends; “...provision shall be made to replace stale fuel or clean fuel.”

Preferred Utilities’ Filtration Sets are the most complete, efficient and reliable engine protection systems you can install. These self-contained fully automatic systems remove water, suspended rust, dirt and other contaminants in order to maintain the quality and purity of stored diesel fuel.

Benefits:

- 1. Cleans and Dewater Fuel** – Automatic cycling ensures continuous fuel maintenance.
- 2. Nearly 100% Water Removal** – “ALGAE” growth is inhibited with the absence of water.
- 3. Particulate Removal To 2 Microns** – Improves fuel system and engine performance.
- 4. Fuel System Monitoring** – Water, filter saturation and leak indications make operators aware of maintenance requirements.

Systems are available in standard sizes ranging from 180 to 1200 gallons per hour. Custom units for processing 50 gallons per minute or more are also available.

31-35 South St., Danbury, CT. 06810 • 203-743-6741 / Fax: 203-798-7313 •
